DATA ANALYSIS PORTFOLIO

By Armani Chalmers

Professional Background

I'm a detail-oriented aspiring Data Analyst looking to further my knowledge and experience.

I'm in pursuit of a new career in data analytics. Holding a Bachelors Degree in Music Business, I have recently pivoted into tech for better opportunities.

In my last position, I worked with Salesforce and I'm working on diving deeper into the analytical side in the future.

I've recently stepped into a new position working with data such as collecting, importing, and cleaning. I bring a set of valuable talents such as my analytical mind, organization, and strategic thinking. I have a knack for problem-solving and research.

I've been working on upskilling not only with data analytics, but also with project management skills to help my organization and leadership skills. I recently obtained a ScrumMaster Certification, a Jira Fundamentals badge, as well as gained more knowledge in Agile framework. I'm highly dedicated to growing as a data professional and will continue to learn more in hopes of landing the right job opportunity.

Thank you for your time and consideration.

Thank you

Udemy Project Description/Business Problem

As a Data Analyst for Udemy, I was given 3 weeks to present data on how and where we can increase revenue in order to increase quarterly earnings. I collected data such as course subjects, price per course (whether they were free or paid), number of subscribers, and course level,

This report will show which courses and subjects are the least and most popular. With Web Development being the most popular subject, The findings will determine which of its levels' prices can be increased most. The data will also determine which subjects and levels students are most satisfied with based on ratings.

This data is represented with pie charts and bar charts.

Data Design

Data Cleaning:

To clean the data, duplicates and blanks were removed. All headers, as well as the Web Development subject title were reformatted to keep consistent with the other headers and subject formats.

Data Visualization:

Pivot tables and charts were created in Google Sheets and Tableau to visualize and support the data findings and answer the business problem.

Findings

Figure 1: Total Number of Subscribers for each Subject (Google Sheets)

Web Development has the highest number of subscribers, showing us that it is the most popular subject.

Figure 2: Total Number of Subscribers for each Level (Google Sheets)

The stacked bar chart above determines that the courses teaching all levels of Web Development have the highest number of subscribers.

Findings Cont'd.

Figure 3: Average Cost per Subject at each Level (Tableau)

The bar column bar chart above determines that Web Development at the intermediate level has the highest averaged cost and Graphic Design at the expert level has the lowest.

Figure 4: Average Content Duration by Subject (Tableau)

Web Development has the highest averaged content duration.

Figure 5: Average Rating per Subject for each Level (Google Sheets)

Graphic Design has the highest ratings, especially the expert level courses.

Analysis

Root Cause Analysis is the process used to find what the root cause/underlying problem is in order to figure out how to solve the problem.

- Why is Web Development driving in the most revenue?
- Why is Web Development the most popular subject?
- Why doesn't Web Development have the highest ratings?
- Why is Musical Instruments driving in the least revenue?
- Why is Musical Instruments the least popular subject?

Based on the data and visualization findings, Web Development is the most popular subject for courses. Business Finance is the second most popular, followed by Graphic Design and Musical Instruments. Although Web Development is the most popular, the findings show that it does not have the highest ratings on average and that may be due to the price points and/or quality of content. However, Web Development has the highest content duration, and this is what is driving user purchases and retention. Furthermore, the findings show that the expert level across all subjects has the lowest average cost. All levels of each subject have the highest number of subscribers, indicating that our users find more value in learning the subjects at all levels instead of specific levels.

Conclusion

The data concludes that a slight price increase in Web Development will generate revenue growth for the company due to its largest number of subscribers overall. The price point can also be slightly increased across all subjects at the expert level as well as better quality content to drive up the ratings. Web Development will continue to lead due to the current popularity of tech so we must commit to making sure that we are delivering quality content so that our users can find value in it. It is highly recommended to increase Web Development prices in order to increase the business' revenue.
